Hard Problems for Fast Learners

Name: Yash Pandey

UID: 22BCS15020

Section: 601-A

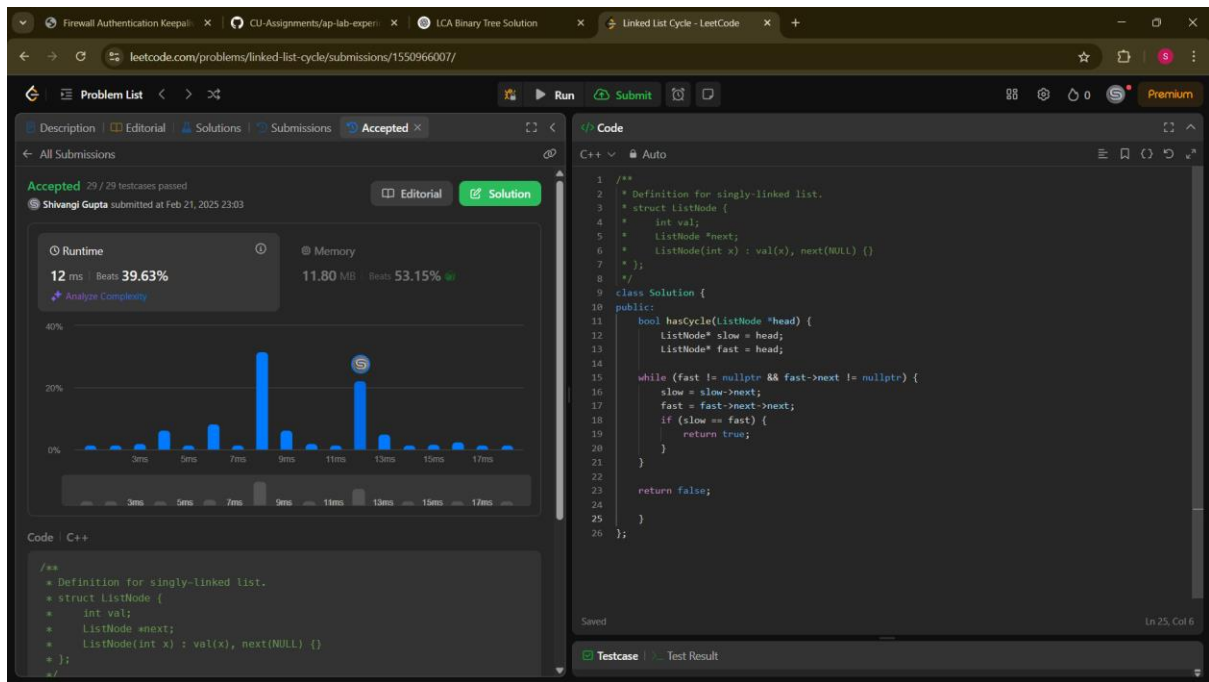

Ques 1. Linked List Cycle <https://leetcode.com/problems/linked-list-cycle/description/>

Code:

```
class Solution {
public:
    bool hasCycle(ListNode *head) {
        ListNode* slow = head;
        ListNode* fast = head;

        while (fast != nullptr && fast->next != nullptr) {
            slow = slow->next;
            fast = fast->next->next;
            if (slow == fast) {
                return true;
            }
        }

        return false;
    }
};
```

Q2. Longest substring without repeating characters <https://leetcode.com/problems/longest-substring-without-repeating-characters/description/>

CODE:

```
class Solution {
```

```
public:
```

```
    int lengthOfLongestSubstring(string s) {
```

```
        int left = 0;
```

```
        int maxLength = 0;
```

```
        unordered_set<char> charSet;
```

```
        for (int right = 0; right < s.length(); right++) {
```

```
            while (charSet.find(s[right]) != charSet.end()) {
```

```
                charSet.erase(s[left]);
```

```
                left++;
```

```
            }
```

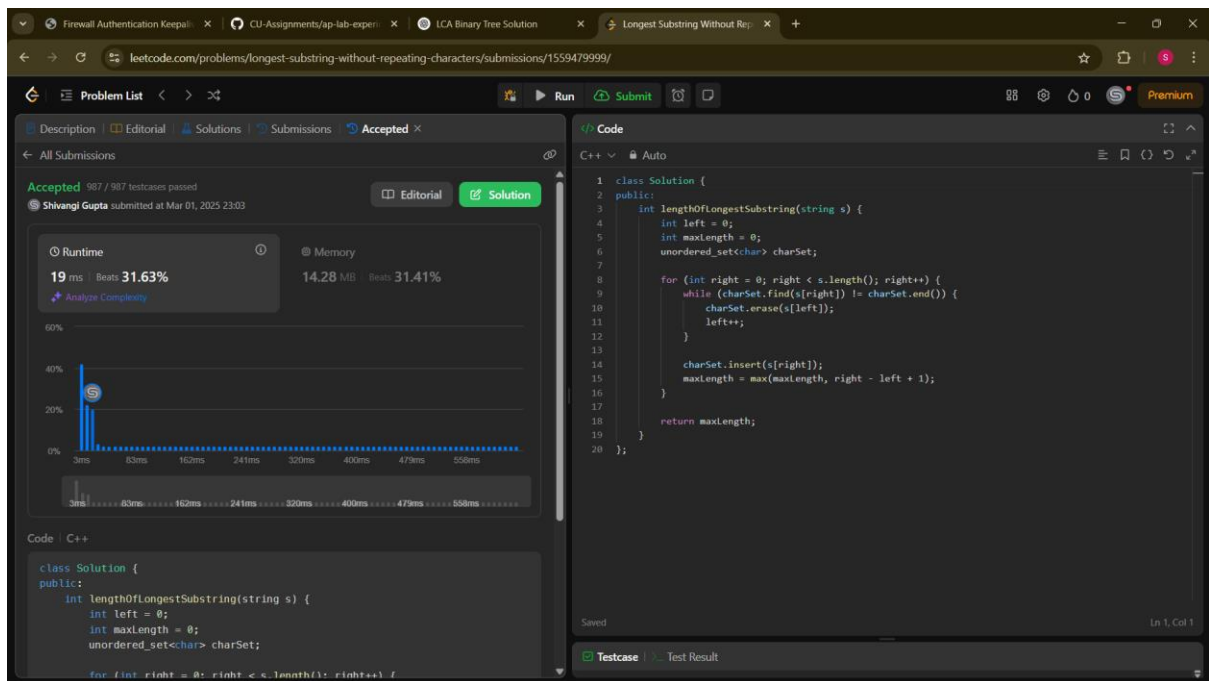

```
            charSet.insert(s[right]);
```

```

        maxLength = max(maxLength, right - left + 1);
    }

    return maxLength;
}
};

```

Q3. Search a 2D matrix II <https://leetcode.com/problems/search-a-2d-matrix-ii/description/>

Code:

```

class Solution {
public:
    bool searchMatrix(vector<vector<int>>& matrix, int target) {
        int rows=matrix.size();
        int cols=matrix[0].size();
        if (rows == 0) return false;
        int s=0,e=rows*cols-1;
        while(s<=e){

```

```

        int mid=s+(e-s)/2;

        int midValue=matrix[mid/cols][mid%cols];

        if(target==midValue) return true;

        else if(midValue<target) s=mid+1;

        else e=mid-1;

    }

    return false;

}

};

```

The screenshot shows the LeetCode interface for the 'Search a 2D Matrix II' problem. The submission by Shivangi Gupta is marked as 'Accepted' and shows a runtime of 58 ms, which is 36.17% better than the average. The code is written in C++ and uses a binary search approach to find the target in a 2D matrix.

```

class Solution {
public:
    bool searchMatrix(vector<vector<int>>& matrix, int target) {
        int rows=matrix.size();
        int cols=matrix[0].size();
        if (rows == 0) return false;
        int s=0,e=rows*cols-1;
        while(s<=e){
            int mid=s+(e-s)/2;
            int midValue=matrix[mid/cols][mid%cols];
            if(target==midValue) return true;
            else if(midValue<target) s=mid+1;
            else e=mid-1;
        }
        return false;
    }
};

```

Q4. The Skyline Problem <https://leetcode.com/problems/the-skyline-problem/>

Code:

```

vector<vector<int>> getSkyline(vector<vector<int>>& buildings) {

    vector<vector<int>> result;

    vector<pair<int, int>> events;

    for (auto& building : buildings) {

```

```

    int left = building[0], right = building[1], height = building[2];
    events.push_back({left, -height});
    events.push_back({right, height});
}

sort(events.begin(), events.end(), [](const pair<int, int>& a, const pair<int, int>& b) {
    if (a.first == b.first) {
        return a.second > b.second;
    }
    return a.first < b.first;
});

priority_queue<int> maxHeap;
maxHeap.push(0);

int prevMaxHeight = 0;

for (auto& event : events) {
    int x = event.first;
    int height = event.second;

    if (height < 0) {
        maxHeap.push(-height);
    } else {
        maxHeap.push(height);
    }

    int currentMaxHeight = maxHeap.top();

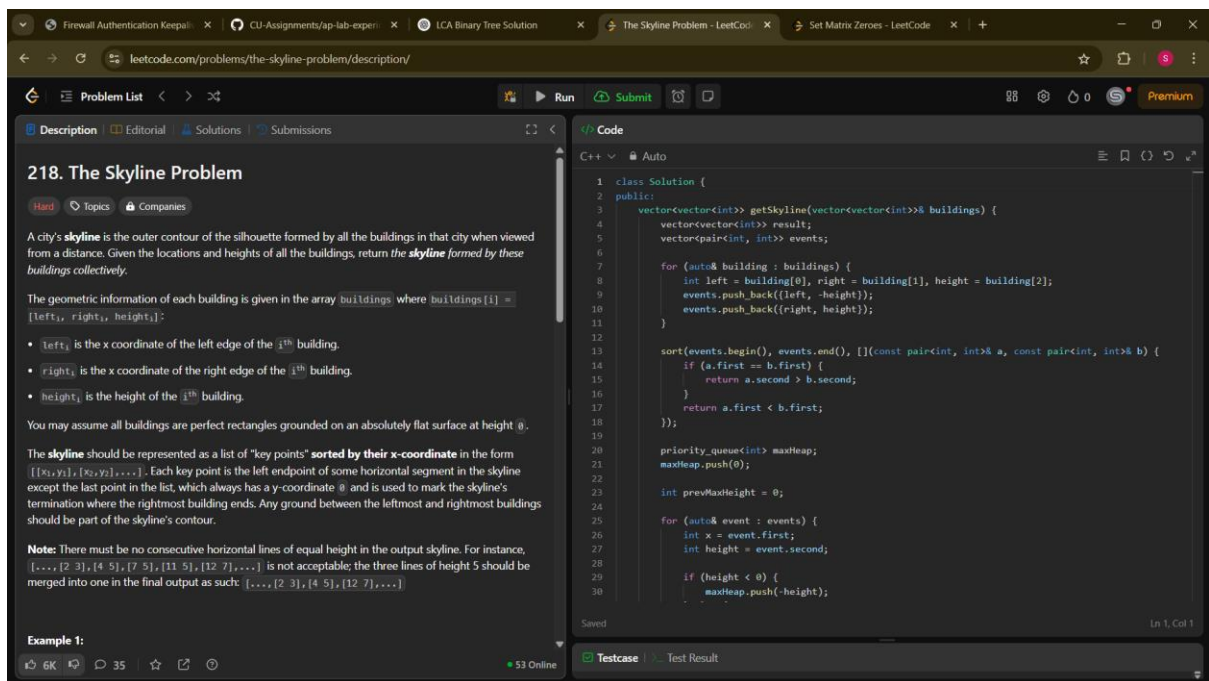

```

```

        if (currentMaxHeight != prevMaxHeight) {
            result.push_back({x, currentMaxHeight});
            prevMaxHeight = currentMaxHeight;
        }
    }

    return result;
}

```

Q5. Set matrix zeroes <https://leetcode.com/problems/set-matrix-zeroes/>

CODE:

```

class Solution {
public:
    void setZeroes(vector<vector<int>>& matrix) {
        int m = matrix.size(), n = matrix[0].size();
        bool firstColZero = false;

```

```

for (int i = 0; i < m; ++i) {
    if (matrix[i][0] == 0) firstColZero = true;
    for (int j = 1; j < n; ++j) {
        if (matrix[i][j] == 0) {
            matrix[i][0] = 0;
            matrix[0][j] = 0;
        }
    }
}

for (int i = m - 1; i >= 0; --i) {
    for (int j = n - 1; j >= 1; --j) {
        if (matrix[i][0] == 0 || matrix[0][j] == 0)
            matrix[i][j] = 0;
    }
    if (firstColZero)
        matrix[i][0] = 0;
}
};

73. Set Matrix Zeroes

MediumTopicsCompaniesHint

Given an $m \times n$ integer matrix `matrix`, if an element is 0, set its entire row and column to 0's.

You must do it [in place](#).

Example 1:

1	1	1		1	0	1
1	0	1	→	0	0	0
1	1	1		1	0	1

Input: `matrix = [[1,1,1],[1,0,1],[1,1,1]]`
Output: `[[1,0,1],[0,0,0],[1,0,1]]`

Example 2:

0	1	2	0		0	0	0	0
3	4	5	2	→	0	4	5	0

C++Auto

```
1 class Solution {
2 public:
3     void setZeroes(vector<vector<int>>& matrix) {
4         int m = matrix.size(), n = matrix[0].size();
5         bool firstColZero = false;
6
7         for (int i = 0; i < m; ++i) {
8             if (matrix[i][0] == 0) firstColZero = true;
9             for (int j = 1; j < n; ++j) {
10                 if (matrix[i][j] == 0) {
11                     matrix[i][0] = 0;
12                     matrix[0][j] = 0;
13                 }
14             }
15         }
16
17         for (int i = m - 1; i >= 0; --i) {
18             for (int j = n - 1; j >= 1; --j) {
19                 if (matrix[i][0] == 0 || matrix[0][j] == 0)
20                     matrix[i][j] = 0;
21             }
22             if (firstColZero)
23                 matrix[i][0] = 0;
24         }
25     }
26 }
```
